Overview

User Interface (UI) and User Experience (UX) Designers work together to develop seamless and enjoyable digital experiences that are easy to use. UX/UI Designers combine creativity with technical skills to help develop technology that people love to use.

UI design uses visual tools like colour, fonts, scale, and alignment (to name a few) to make sure the experience looks great. Whereas UX design is all about user needs, testing and changing the experience to make it as easy and fun to use as possible.

3 signs you should consider UX/UI design:

- You love solving problems creatively
- You have an eye for detail and design
- You love working with tech
